

Product Information

Pre-Filled Clutch Hydraulic Systems

Platinum Driveline offers a line of pre-filled clutch hydraulic systems and pre-filled clutch master cylinders. Some bleeding procedures can take up to an hour or more, and these PDL hydraulic systems can potentially eliminate the added labor charges associated with the additional bleeding.

A typical system has a pedal pulsation damper and can become contaminated in these cases, bleeding the system may become a difficult task.

The complete system includes the master cylinder and slave cylinder. There are no additional components needed for installation. This can be advantageous in applications with difficult or time-consuming bleeding procedures.

The pre-filled clutch master cylinders include a hydraulic line with a quick disconnect. These master cylinders must be used with the OE slave cylinder, or a new slave cylinder purchased separately. After installation of a clutch and pre-filled master cylinder, all you need to do is fill the slave cylinder which takes a few minutes. Typical bleeding procedures can take an hour or more.
